CLINICAL REMARKS / LAB NOTES

1. Haematology: Patient exhibits mild normocytic anaemia with reduced haemoglobin and PCV. Leukocytosis with neutrophilia suggests an ongoing bacterial infection or inflammatory process. Platelet count is at the lower borderline — clinical correlation advised.

2. Glycaemic Status: Fasting and post-prandial glucose levels are significantly elevated. HbA1c of 8.4% confirms poorly controlled Type 2 Diabetes Mellitus. Immediate dietary and pharmacological review recommended.

3. Lipid Profile: Dyslipidaemia noted — elevated total cholesterol, LDL, VLDL, and triglycerides with low HDL. Cardiovascular risk is high. Statin therapy review warranted.

4. Renal Function: Serum creatinine elevated with eGFR of 48 mL/min/1.73m2, indicating Stage 3A Chronic Kidney Disease (CKD). Uric acid is also raised. Nephrology referral advisable.

5. Hepatic Enzymes: Mildly elevated SGOT/SGPT may be related to fatty liver changes secondary to diabetes and dyslipidaemia. Ultrasound abdomen recommended.

6. Thyroid: Elevated TSH with low Free T4 is consistent with Primary Hypothyroidism. Thyroid replacement therapy should be reviewed by the treating physician.
